

# Evolutionary Computing

## in the Study of Bio/Chemical Mechanisms

Petr Kuzmič, Ph.D.  
BioKin, Ltd.

*Problem:*

Finding initial parameter estimates

*Solution:*

Differential Evolution (DE)

*Model selection strategy:*

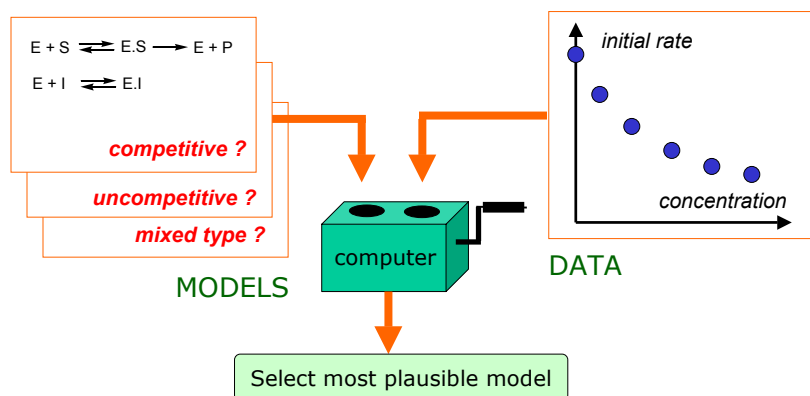

**"Supermodel Evolution"**

*Example:*

Inhibition of Lethal Factor protease by curcumin

## The task of mechanistic enzyme kinetics

SELECT AMONG MULTIPLE CANDIDATE MECHANISMS

# Most models in bio/chemical kinetics are nonlinear

## LINEAR VS. NONLINEAR MODELS

Linear

$$y = A + k x$$

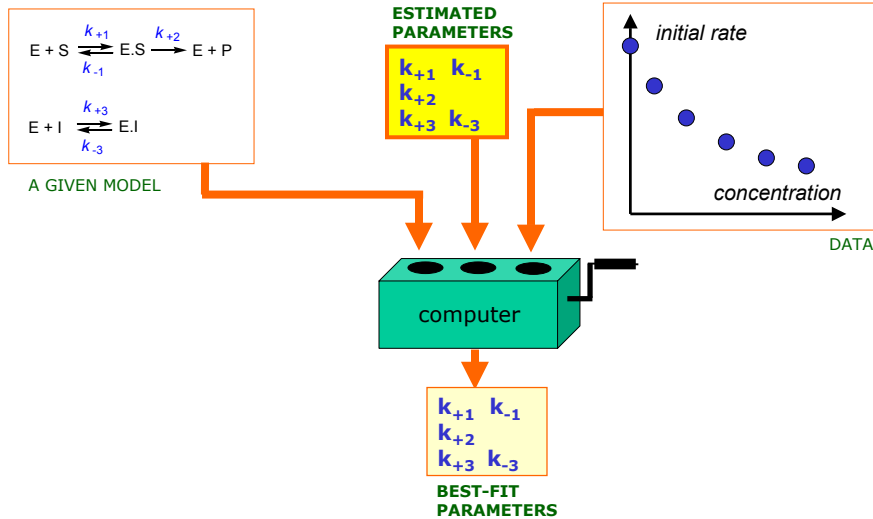

Nonlinear

$$y = A [1 - \exp(-k x)]$$

# We need initial estimates of model parameters

## NONLINEAR MODELS REQUIRE INITIAL ESTIMATES OF PARAMETERS

# Anthrax bacillus

CUTANEOUS AND INHALATION ANTHRAX DISEASE

# Lethal Factor (LF) protease from *B. anthracis*

CLEAVES MITOGEN ACTIVATED PROTEIN KINASE KINASE (MAPKK)

## Neomycin B: an aminoglycoside inhibitor

A POTENT INHIBITOR OF LF PROTEASE

*Streptomyces fradiae*

## Neomycin B mechanism: mixed-type noncompetitive

NEOMYCIN B INHIBITION FOLLOWS A COMPLEX MOLECULAR MECHANISM

### Mixed-type noncompetitive inhibition of anthrax lethal factor protease by aminoglycosides

Petr Kuzmic<sup>1</sup>, Lynne Cregar<sup>2</sup>, Sherri Z. Millis<sup>2</sup> and Mark Goldman<sup>2,\*</sup>

<sup>1</sup> BioKin Ltd, Pullman, WA, USA

<sup>2</sup> Hawaii Biotech Inc., Aiea, HI, USA

P. Kuzmic et al.

Scheme 5. Mixed-type mechanism.

Kuzmic et al. (2006) *FEBS J.* **273**, 3054-3062.

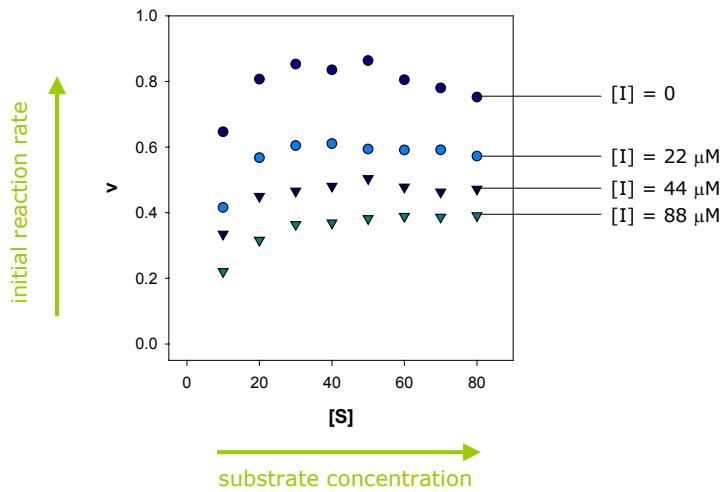

# Curcumin: an natural product inhibitor

INHIBITION MECHANISM UNKNOWN

# LF protease inhibition by curcumin: raw data

SUBSTRATE INHIBITION (MAXIMUM ON SUBSTRATE SATURATION CURVE)

## Two separate problems to solve

A PREREQUISITE FOR MODEL DISCRIMINATION = FITTING INDIVIDUAL CANDIDATE MODELS

### 1. Focus on a *single* reaction mechanism:

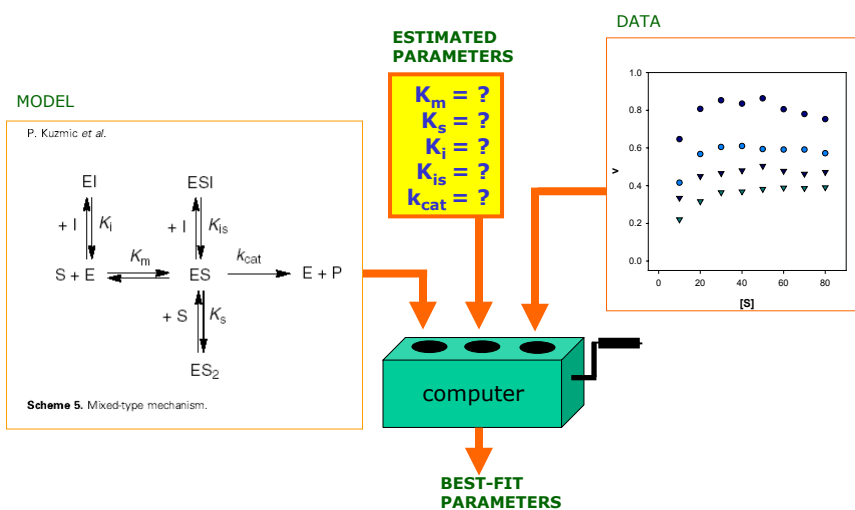

Given a model (rate equation), find the best-fit kinetic constants

### 2. Focus on *multiple* reaction mechanisms:

- Repeat 1. for all candidate models (mechanisms)
- Select the most plausible model

## The mixed-type inhibition model

CONTAINS **FIVE** KINETIC CONSTANTS

## First major difficulty: Sensitivity to initial estimates

TRADITIONAL DATA-FITTING: RESULTS DEPEND ON THE INITIAL GUESS

$K_m = 1$   
 $K_s = 1$   
 $K_i = 1$   
 $K_{is} = 1$   
 $k_{cat} = 1$

ESTIMATE #1

"uncompetitive" ?

$K_m = 2000$   
 $K_s = 0.6$   
 $K_i \sim \infty$   
 $K_{is} = 0.0001$   
 $k_{cat} = 5100$

## First major difficulty: Sensitivity to initial estimates

TRADITIONAL DATA-FITTING: RESULTS DEPEND ON THE INITIAL GUESS

$K_m = 100$   
 $K_s = 100$   
 $K_i = 100$   
 $K_{is} = 100$   
 $k_{cat} = 100$

ESTIMATE #2

$K_m < 0.000001$   
 $K_s = 0.004$   
 $K_i = 0.002$   
 $K_{is} = 0.02$   
 $k_{cat} = 54000$

## First major difficulty: Sensitivity to initial estimates

TRADITIONAL DATA-FITTING: RESULTS DEPEND ON THE INITIAL GUESS

$K_m = 10$   
 $K_s = 100$   
 $K_i = 10$   
 $K_{is} = 100$   
 $k_{cat} = 100$

ESTIMATE #3

mixed-type ?

$K_m = 10$   
 $K_s = 110$   
 $K_i = 40$   
 $K_{is} = 14$   
 $k_{cat} = 68$

## First major difficulty: Sensitivity to initial estimates

TRADITIONAL DATA-FITTING: RESULTS DEPEND ON THE INITIAL GUESS

$K_m = 10$   
 $K_s = 100$   
 $K_i = 10$   
 $K_{is} = 100$   
 $k_{cat} = 100$

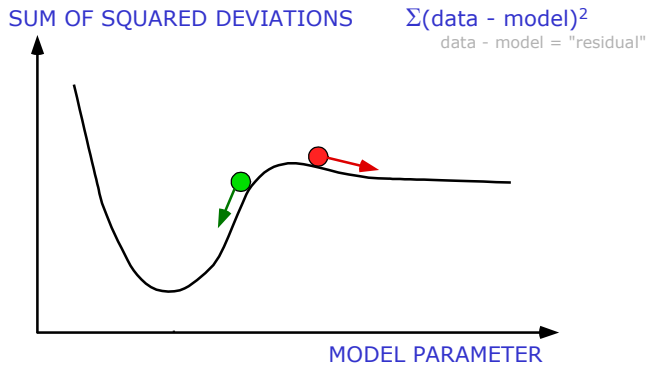

ESTIMATE #3

$K_m = 10$   
 $K_s = 110$   
 $K_i = 40$   
 $K_{is} = 14$   
 $k_{cat} = 68$

Is this the best we can do with the mixed-type model?

## The crux of the problem: Finding *global* minima

- Least-squares fitting **only** goes "downhill"
- **How do we know where to start?**

## Charles Darwin to the rescue

BIOLOGICAL EVOLUTION IMITATED IN "DE"

Charles Darwin (1809-1882)

## Biological metaphor: "Gene, allele"

### BIOLOGY

#### gene

four-letter alphabet  
variable length

### COMPUTER

- sequence of bits representing a number

- two letter alphabet
- fixed length (16 or 32 bits)

## "Chromosome, genotype, phenotype"

### BIOLOGY

#### genotype

...AAGTCGGTTCGGAAGTCGGTTA...

phenotype

### COMPUTER

- particular combination of all model parameters

$$v = V_{\max} \frac{[S]/K_M}{1 + [S]/K_M + [S]^2/K_M K_{is}}$$

# "Organism, fitness"

## BIOLOGY

genotype

...AAGTCGGTTCGGAAGTCGGTTTA...

**FITNESS:**  
"agreement" with the environment

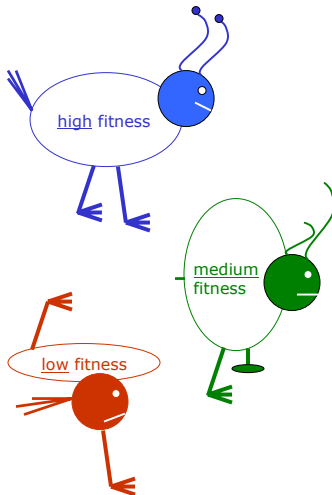

## COMPUTER

- FITNESS:**  
agreement between the data and the model

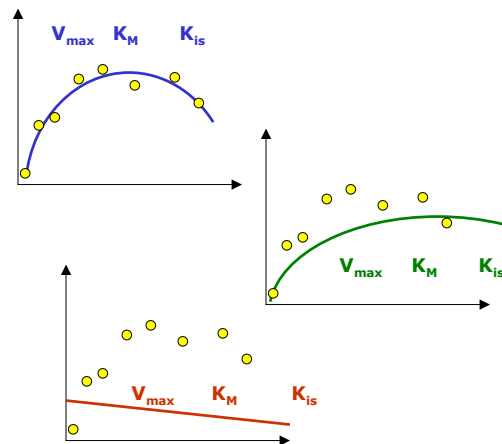

# "Population"

## BIOLOGY

## COMPUTER

## DE Population size in DynaFit

```
DynaFit : settings.txt
File Edit View Help
Input Output

{DifferentialEvolution}
  Strategy = 2
  PopulationSizePerParameter = 50
  PopulationSizePerOrderOfMag = 5
  MaximumGenerationsPerParameter = 100
  CombineGenerations = 1
  RandomSeed = 1345
  HistogramBins = 10
  ReportFrequency = 1
  Weight = 0.9
  Crossover = 0.9
  StopParameterRange = 0.0001
```

number of population members **per optimized model parameter**

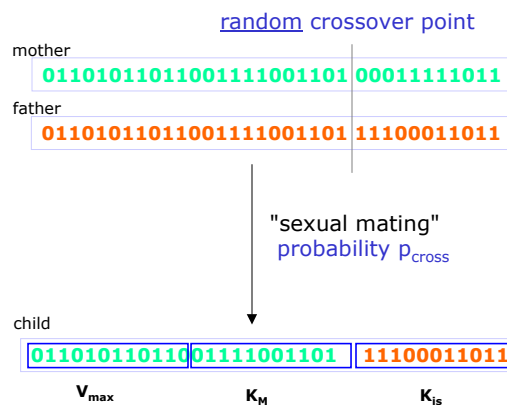

number of population members **per order of magnitude**

## "Sexual reproduction, crossover"

BIOLOGY

COMPUTER

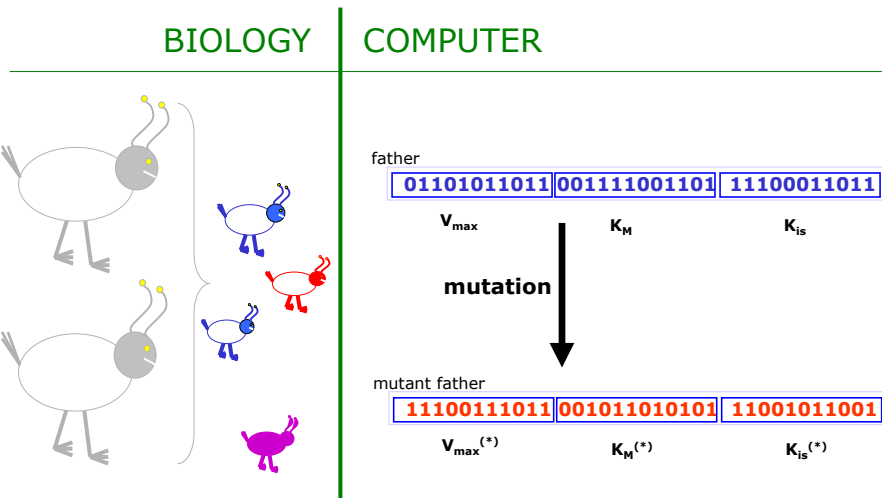

## DE Crossover probability in DynaFit

```

DynaFit : settings.txt
File Edit View Help
Input Output
{DifferentialEvolution}
  Strategy                = 2
  PopulationSizePerParameter = 50
  PopulationSizePerOrderOfMag = 5
  MaximumGenerationsPerParameter = 100
  CombineGenerations       = 1
  RandomSeed               = 1345
  HistogramBins            = 10
  ReportFrequency          = 1
  Weight                   = 0.9
  Crossover                 = 0.9
  StopParameterRange       = 0.0001
  
```

probability that **child** inherits **father's** genes, not **mother's** genes

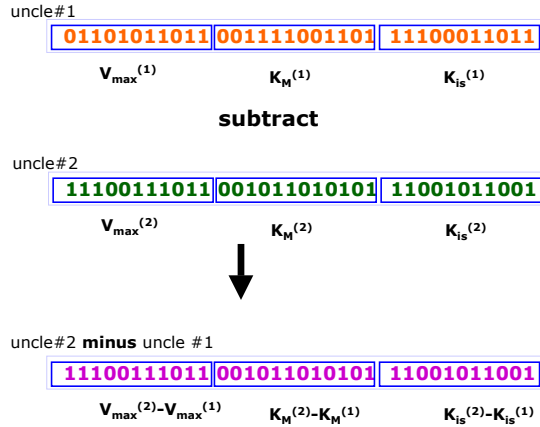

## "Mutation, genetic diversity"

## "Mutation, genetic diversity"

### THE "DIFFERENTIAL" IN DIFFERENTIAL EVOLUTION ALGORITHM - STEP 1

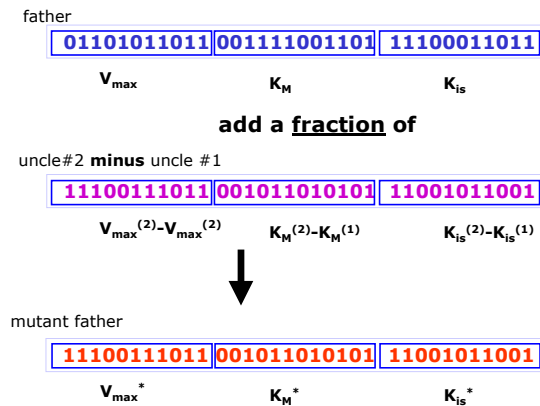

Compute difference between two randomly chosen "uncle" phenotypes

## "Mutation, genetic diversity"

### THE "DIFFERENTIAL" IN DIFFERENTIAL EVOLUTION ALGORITHM - STEP 2

Add **weighted** difference between two "uncle" phenotypes to "father"

# "Mutation, genetic diversity"

THE "DIFFERENTIAL" IN DIFFERENTIAL EVOLUTION ALGORITHM

EXAMPLE: Michaelis-Menten equation  $v = V_{\max} \frac{[S]}{[S] + K_M}$

"mutant father"  $\longrightarrow K_M^* = K_M + \mathbf{F} \times (K_M^{(1)} - K_M^{(2)})$

"father"  $\downarrow$  "uncle 1"  $\downarrow$  "uncle 2"  $\downarrow$

$\uparrow$   
weight (fraction)  
mutation rate

# DE Mutation rate in DynaFit

```
DynaFit : settings.txt
File Edit View Help
Input Output
{DifferentialEvolution}
Strategy = 2
PopulationSizePerParameter = 50
PopulationSizePerOrderOfMag = 5
MaximumGenerationsPerParameter = 100
CombineGenerations = 1
RandomSeed = 1345
HistogramBins = 10
ReportFrequency = 1
Weight = 0.9
Crossover = 0.9
StopParameterRange = 0.0001
```

fractional difference  
used in mutations

$K_M^* = K_M + \mathbf{F} \times (K_M^{(1)} - K_M^{(2)})$

## DE Mutation strategies in DynaFit

```

DynaFit : settings.txt
File Edit View Help
Input Output
{DifferentialEvolution}
Strategy = 2
PopulationSizePerParameter = 50
PopulationSizePerOrderOfMag = 5
MaximumGenerationsPerParameter = 100
CombineGenerations = 1
RandomSeed = 1345
HistogramBins = 10
ReportFrequency = 1
Weight = 0.9
Crossover = 0.9
StopParameterRange = 0.0001
    
```

**six** different mutation strategies (1, 2, ... 6)

details in the book:

## "Selection"

### BIOLOGY

### COMPUTER

more likely to breed

less likely to breed

low sum of squares

01101011011 | 00111100110 | 00011111011

$V_{max}$   $K_M$   $K_{is}$

more likely to be carried to the next generation

high sum of squares

00000000001 | 11111111111 | 00000000000

$V_{max}$   $K_M$   $K_{is}$

less likely to be carried to the next generation

## Basic Differential Evolution Algorithm - Summary

1 **Randomly** create the initial population (size **N**)

Repeat until almost all population members have very high fitness:

- 2 **Evaluate fitness:** sum of squares for all population members
- 3 **Mutation:** **random** gene modification (mutate *father*, weight **E**)
- 4 **Sexual reproduction:** **random** crossover with probability **P<sub>cross</sub>**
- 5 **Natural selection:** keep *child* in gene pool if more fit than *mother*

## Application to curcumin: Mixed-type mechanism

THREE EXAMPLES OF POPULATION MEMBERS (**POPULATION SIZE  $n = 845$** )

### POPUL. MEMBER #1

Km	3.3355e-11
Ks	7868500
Ki	106.99
Kis	4.0737e-9
kcat	29.783

### POPUL. MEMBER #7

Km	3713600
Ks	60218
Ki	427880
Kis	153.55
kcat	918170

### POPUL. MEMBER #642

Km	65.7630
Ks	1.0488e-3
Ki	8.7928e-10
Kis	8.1374e+20
kcat	3760400

## Application to curcumin: Mixed-type mechanism

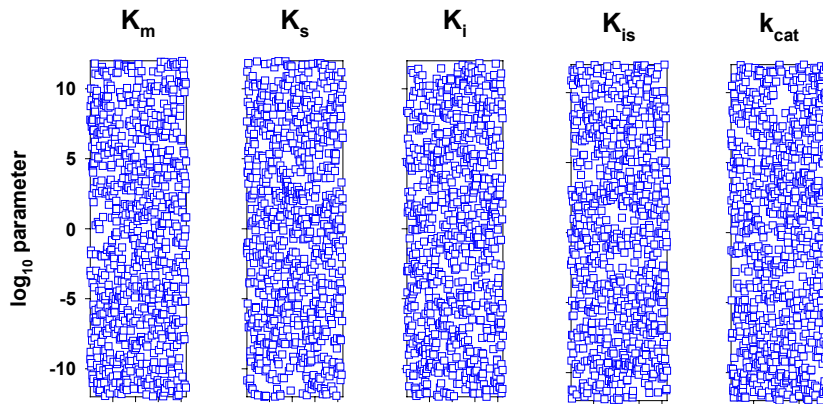

INITIAL DISTRIBUTION OF THE MICHAELIS-CONSTANT  $K_M$

24 orders  
of magnitude

## Application to curcumin: Mixed-type mechanism

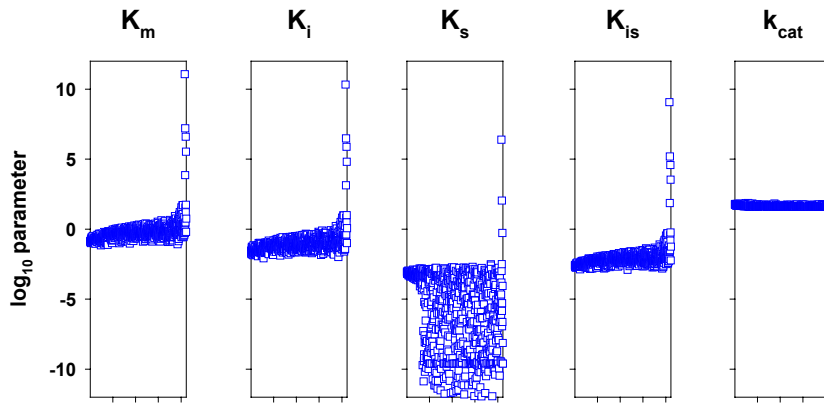

INITIAL DISTRIBUTION OF ALL MODEL PARAMETERS

Generation #1

## Application to curcumin: Mixed-type mechanism

INTERMEDIATE DISTRIBUTION OF MODEL PARAMETERS (EVOLUTION IS ONGOING)

Generation #20

## Application to curcumin: Mixed-type mechanism

FINAL DISTRIBUTION OF MODEL PARAMETERS (EVOLUTION IS COMPLETED)

Generation #125

## Application to curcumin: Mixed-type mechanism

THE SUPER-ORGANISM

### The fittest "phenotype" in generation #125

Yes, this **is** the best we can do with the mixed-type model!

## The model selection problem remains

A PREREQUISITE FOR MODEL DISCRIMINATION = FITTING INDIVIDUAL CANDIDATE MODELS

### 1. Focus on a *single* reaction mechanism: ✓

Given a model (rate equation), find the best-fit kinetic constants

### 2. Focus on *multiple* reaction mechanisms:

- Repeat 1. for **all** candidate models (mechanisms)
- Select the most plausible model

## Model proliferation: CYP450 / reductase example

COMBINATORIAL PROLIFERATION OF POSSIBLE MECHANISMS

EXAMPLE

### Global Analysis of Protein-Protein Interactions Reveals Multiple Cytochrome P450 2E1 / Reductase Complexes

Arvind P. Jamakhandi<sup>†</sup>, Petr Kuzmič<sup>§</sup>, Daniel E. Sanders<sup>†</sup>, and Grover P. Miller<sup>†</sup>

Journal: *Biochemistry* Ms# **BI-2006-003476.R2** IN PRESS

## Model proliferation: CYP450 / reductase example

COMBINATORIAL PROLIFERATION OF POSSIBLE MECHANISMS

**P** = cytochrome P450 (2E1)

**R** = cytochrome reductase

Model#	Complex				
	PR	P2R	PR2	P2R2	P2
1	A				
2	A	A			
3	A		A		
4	A	A	A		
5	A			A	
6	A	A		A	
7	A		A	A	
8	A	A	A	A	N
9	A				N
10	A	A			N
11	A		A		N
12	A	A	A		N
13	A			A	N
14	A	A		A	N
15	A		A	A	N
16	A	A	A	A	N

A = catalytically active  
N = inactive

**42** separate mechanisms were examined

## The "Supermodel" approach

CREATE AN **AGGREGATE** MODEL ENCOMPASSING ALL POSSIBLE INTERACTIONS

Model#	Complex				
	PR	P2R	PR2	P2R2	P2
1	A				
2	A	A			
3	A		A		
4	A	A	A		
5	A			A	
6	A	A		A	
7	A		A	A	
8	A	A	A	A	N
9	A				N
10	A	A			N
11	A		A		N
12	A	A	A		N
13	A			A	N
14	A	A		A	N
15	A	A	A	A	N
16	A	A	A	A	N

the most complex (realistic) model

1. Consider only the **most complex** model
2. Evolve all parameters using "DE"
3. Identify redundant parameters by examining the final distribution of fittest phenotypes
4. Eliminate redundant parameters thereby reducing the model ("small is beautiful")

## The "Supermodel" for LF inhibition by curcumin

COMPILE AN AGGREGATE OF ALL POSSIBLE MOLECULAR INTERACTIONS

### ASSUMPTIONS

- Substrate can bind with 1:1 or 2:1 stoichiometry
- Inhibitor can bind with 1:1 or 2:1 stoichiometry
- Substrate and inhibitor can bind at the same time
- Any enzyme-substrate complex can have catalytic activity

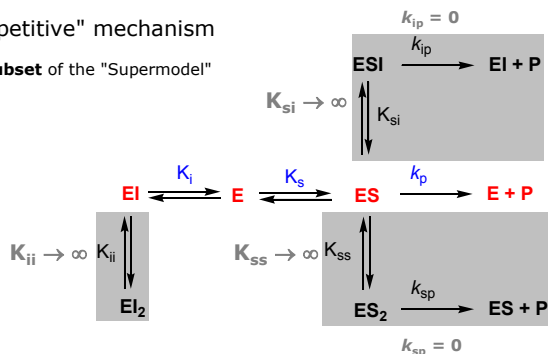

## The "Supermodel" includes all standard mechanisms

STANDARD MECHANISMS DIFFER ONLY BY VALUES OF KINETIC CONSTANTS IN THE "SUPERMODEL"

"Competitive" mechanism

is a **subset** of the "Supermodel"

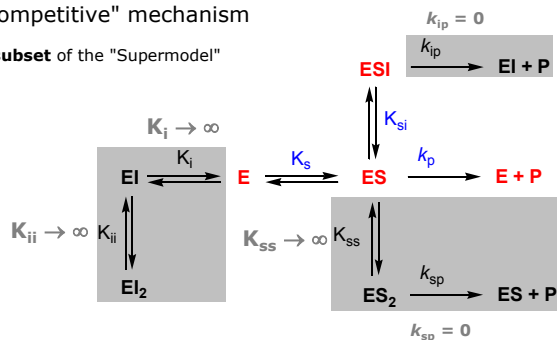

## The "Supermodel" includes all standard mechanisms

STANDARD MECHANISMS DIFFER ONLY BY VALUES OF KINETIC CONSTANTS IN THE "SUPERMODEL"

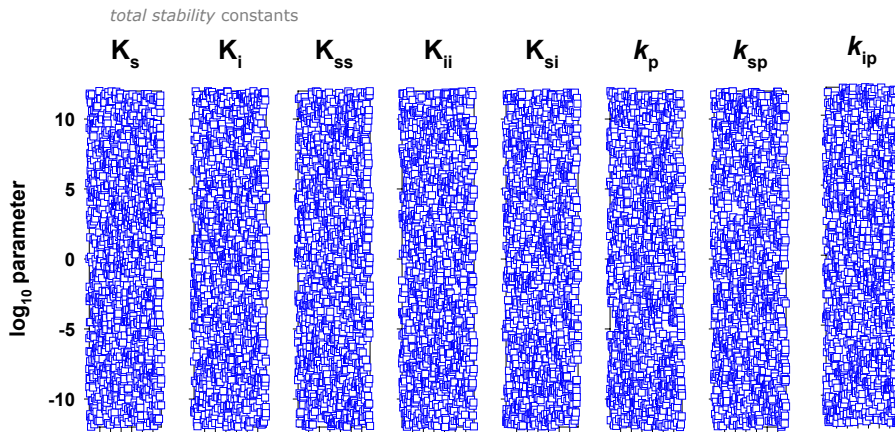

"Uncompetitive" mechanism

is a **subset** of the "Supermodel"

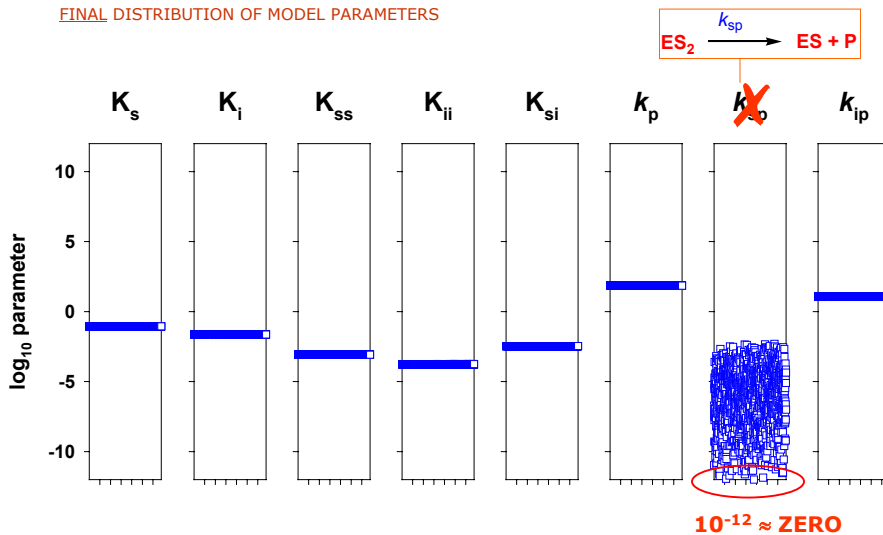

## "Supermodel" evolution: Curcumin inhibition of LF

INITIAL DISTRIBUTION OF MODEL PARAMETERS (POPULATION SIZE = 1355)

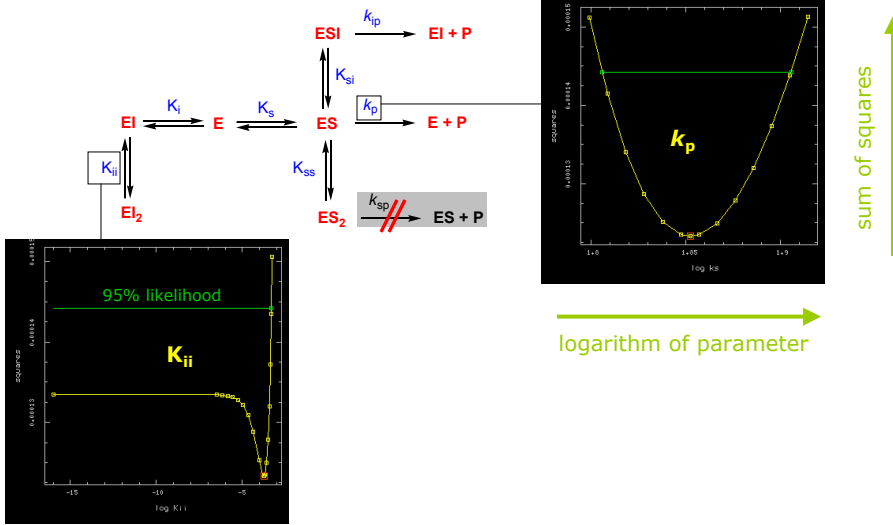

## "Supermodel" evolution: Curcumin inhibition of LF

FINAL DISTRIBUTION OF MODEL PARAMETERS

# Curcumin inhibition of LF: Confidence intervals

ARE ALL PARAMETERS NECESSARY?

# Curcumin inhibition of LF: Final model

FULLY EVOLVED "SUPERMODEL"

Parameter	Best Fit	Low	High
<b>Ks</b>	0.091	0.071	0.118
<b>Ki</b>	0.030	0.023	0.039
<b>Kss</b>	0.00085	0.00077	0.00094
<b>Ksi</b>	0.0029	0.0024	0.0036
<i>k<sub>s</sub></i>	70.5	63.4	79.4
<i>k<sub>si</sub></i>	9.2	6.7	11.4

"Partial Mixed-Type Noncompetitive"  
"With Substrate Inhibition"

## Summary and Conclusions

---

**DIFFERENTIAL EVOLUTION** HAS PROVED USEFUL IN BIO/CHEMICAL KINETICS

- Given a particular model,  
we can always find **globally optimal** parameters:

**DE** avoids false minima and other pathologies in nonlinear data fitting

- Given a set of possible bio/chemical processes,  
we can **"evolve" the most plausible model:**

- 1. Evolve a "Supermodel"
- 2. Exclude redundant reaction steps
- 3. Check confidence intervals
