1. Case study: Inhibition of LF protease from *B. anthracis*
2. Method: **Numerical Enzyme Kinetics**

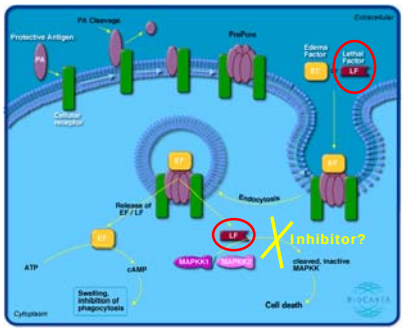
BioKin

Anthrax bacillus

CUTANEOUS AND INHALATION ANTHRAX DISEASE

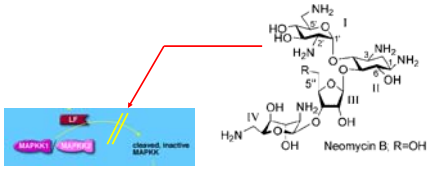
Lethal Factor (LF) protease from *B. anthracis*

CLEAVES MITOGEN ACTIVATED PROTEIN KINASE KINASE (**MAPKK**)



Neomycin B: an aminoglycoside inhibitor

PRESUMABLY A "COMPETITIVE" INHIBITOR OF **LF** PROTEASE

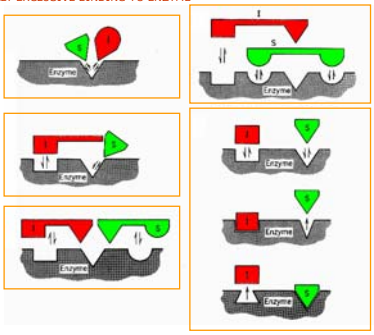


> "All the compounds tested were found to be competitive inhibitors."

Fridman *et al.* (2004) *Angew. Chem. Int. Ed. Eng.* **44**, 447-452

Competitive inhibition - Possible mechanisms

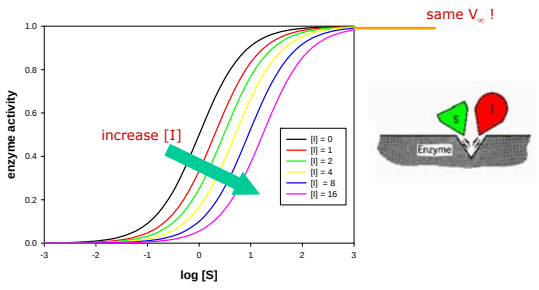
MUTUALLY EXCLUSIVE BINDING TO ENZYME



Segel, I. (1975) *Enzyme Kinetics*, John Wiley, New York, p. 102

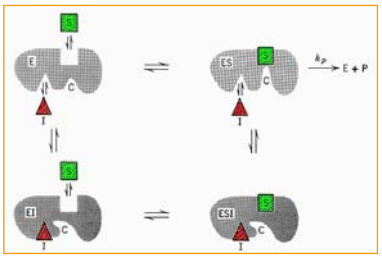
Competitive inhibition - Kinetics

AT VERY HIGH [SUBSTRATE], ANZYME ACTIVITY IS COMPLETELY RESTORED



Non-competitive inhibition - A possible mechanism

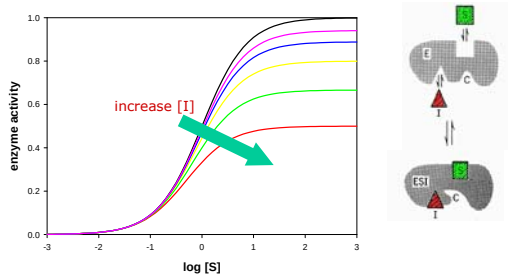
NON-EXCLUSIVE BINDING, BUT TERNARY COMPLEX HAS NO CATALYTIC ACTIVITY



Segel, I. (1975) *Enzyme Kinetics*, John Wiley, New York, p. 126

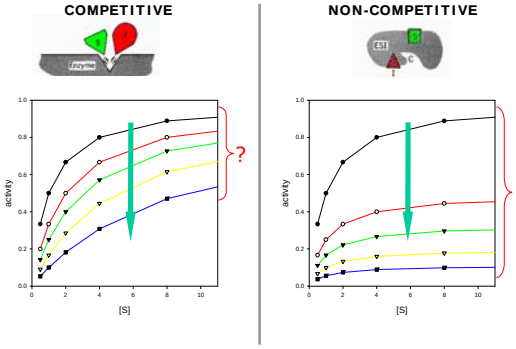
Non-competitive inhibition - Kinetics

EVEN AT VERY HIGH [SUBSTRATE], ANZYME ACTIVITY IS NEVER FULLY RESTORED



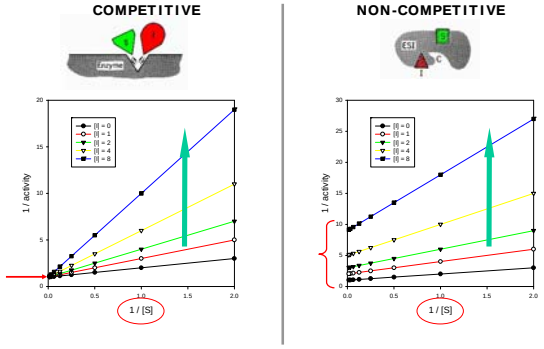
Compare saturation curves

DIAGNOSIS OF MECHANISMS: SAME OR DIFFERENT RATE AT VERY LARGE [S]?



Compare "double-reciprocal" plots

DIAGNOSIS OF MECHANISMS: STRAIGHT LINES INTERCEPT ON VERTICAL AXIS?



Traditional plan to determine inhibition mechanism

THE TRADITIONAL APPROACH

1. Measure enzyme activity at increasing [S]

   Collect multiple substrate-saturation curves at varied [I]

2. Convert [S] *vs.* activity data to **double-reciprocal** coordinates
3. Perform a **linear fit** of transformed (double-reciprocal) data
4. Check if resulting straight lines **intersect** on the vertical axis

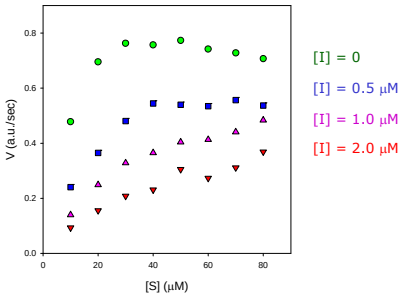
   If yes, declare the inhibition mechanism **competitive**

> of all other compounds were 0, 165, 330, and 550 nM). The K_i values were estimated from double-reciprocal plots of initial velocities as a function of substrate concentration. [b] High-salt conditions: potassium HEPES

Fridman *et al.* (2004) *Angew. Chem. Int. Ed. Eng.* **44**, 447-452

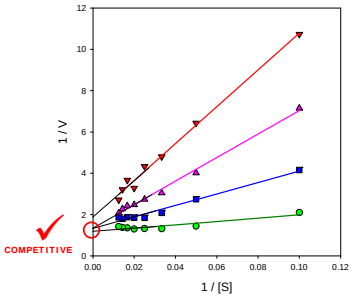
Collect experimental data at varied [S] and [I]

THE RAW DATA



Check for intersection of double-reciprocal plots

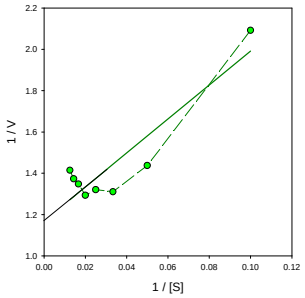
DO LINEWEAVER-BURK PLOTS INTERSECT?



[I] = 0
[I] = 0.5 μM
[I] = 1.0 μM
[I] = 2.0 μM

Doubts begin to appear...

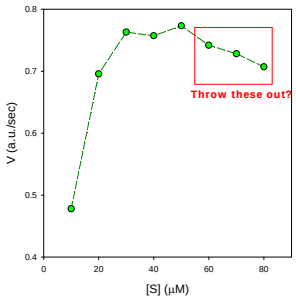
IS THIS A STRAIGHT LINE?



[I] = 0

Mysterious substrate saturation data

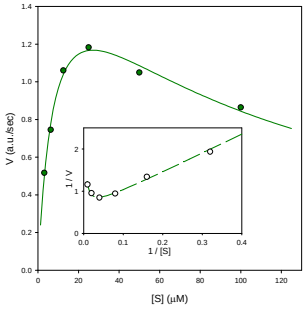
MICHAELIS-MENTEN KINETICS IS NOT SUPPOSED TO SHOW A MAXIMUM !



[I] = 0

Repeat substrate experiment at higher [S]

SEE IF MAXIMUM HOLDS UP AT HIGHER [S]



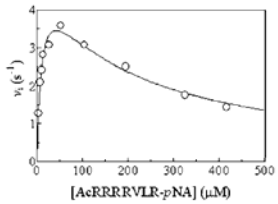
[I] = 0

Substrate inhibition in LF protease is real

HAS ANYONE ELSE SEEN IT?

The Metalloproteolytic Activity of the Anthrax Lethal Factor Is Substrate-inhibited*

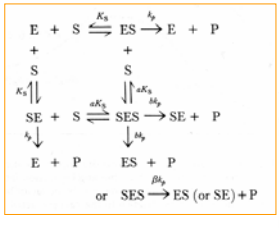
$$v_i = (k_{cat} \times [E] \times [S])/(K_m + [S] + ([S]^2/K_i)) \quad \text{(Eq. 1)}$$



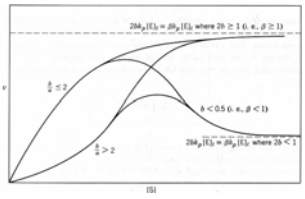
Tonello *et al.* (2003) *J. Biol. Chem.* **278**, 40075-78.

Rate equation for inhibition by substrate

WHAT DOES THE "BIG BLUE BOOK" SAY?



$$\frac{v}{[E]_t} = \frac{k_p \frac{2[S]}{K_S} + 2bk_p \frac{[S]^2}{aK_S^2}}{1 + \frac{2[S]}{K_S} + \frac{[S]^2}{aK_S^2}}$$



Segel, I. (1975) *Enzyme Kinetics*, John Wiley, New York, p. 126

Rate equation for inhibition by substrate + inhibitor

WHAT DOES THE "BIG BLUE BOOK" SAY?

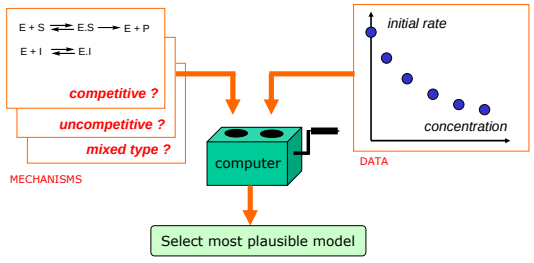
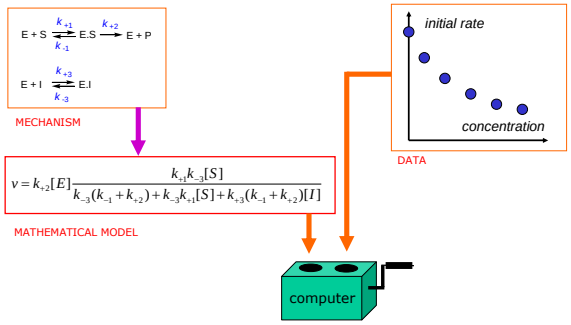
The task of mechanistic enzyme kinetics

SELECT AMONG MULTIPLE CANDIDATE MECHANISMS



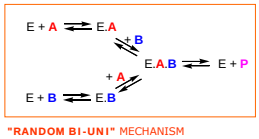
From mechanistic to mathematical models

DERIVE A MATHEMATICAL MODEL FROM BIOCHEMICAL IDEAS



Problem: Simple mechanisms ...

MERELY FIVE REACTIONS ...



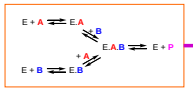
"RANDOM BI-UNI" MECHANISM

- 2 reactants (A, B)
- 1 product (P)
- 5 reversible reactions
- 10 rate constant

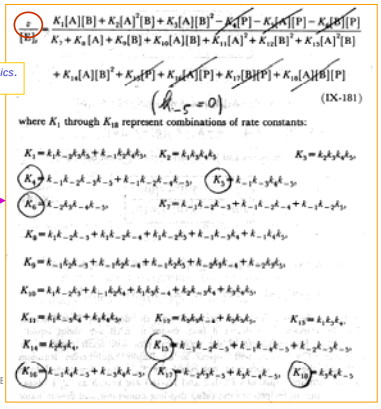
... lead to complex algebraic models

MERELY FIVE REACTIONS ...

Segel, I. (1975) *Enzyme Kinetics*. John Wiley, New York, p. 646.



"RANDOM BI-UNI" MECHANISM



A solution: Forget about algebra

POSSIBLE STRATEGY FOR MECHANISTIC MODEL BUILDING

- Do not even try to derive complex algebraic equations
- Instead, derive *systems* of *simple*, *simultaneous* equations
- Solve these systems using numerical methods

Theoretical foundations: *Mass Action Law*

RATE IS PROPORTIONAL TO CONCENTRATION(S)

"rate" ... "derivative"

MONOMOLECULAR REACTIONS

A ⟶ products

rate is proportional to **[A]**

$-\,d[A]/dt = k[A]$

monomolecular rate constant
1 / time

BIMOLECULAR REACTIONS

A + B ⟶ products

rate is proportional to **[A] × [B]**

$-\,d[A]/dt = -\,d[B]/dt = k[A] \times [B]$

bimolecular rate constant
1 / (concentration × time)

Theoretical foundations: *Mass Conservation Law*

PRODUCTS ARE FORMED WITH THE SAME RATE AS REACTANTS DISAPPEAR

EXAMPLE

A ⟶ P + Q

$-\,d[A]/dt = +\,d[P]/dt = +\,d[Q]/dt$

COMPOSITION RULE ADDITIVITY OF TERMS FROM SEPARATE REACTIONS

mechanism:

A $\xrightarrow{k_1}$ B

B $\xrightarrow{k_2}$ C

$d[B]/dt = +k_1[A] - k_2[B]$

Composition Rule: Example

EXAMPLE MECHANISM

E + A $\underset{k_{-1}}{\overset{k_{+1}}{\rightleftharpoons}}$ EA

EA + B $\underset{k_{-2}}{\overset{k_{+2}}{\rightleftharpoons}}$ EAB

E + B $\underset{k_{-3}}{\overset{k_{+3}}{\rightleftharpoons}}$ EB

EB + A $\underset{k_{-4}}{\overset{k_{+4}}{\rightleftharpoons}}$ EAB

EAB $\xrightarrow{k_{+5}}$ E + P + Q

RATE EQUATIONS

$d[P]/dt = +k_{+5}[EAB]$

$d[EAB]/dt = +k_{+2}[EA]\times[B] - k_{-2}[EAB] + k_{+4}[EB]\times[A] - k_{-4}[EAB] - k_{+5}[EAB]$

Similarly for other species...

A "Kinetic Compiler"

HOW DYNAFIT PROCESSES YOUR BIOCHEMICAL EQUATIONS

E + S $\underset{k_2}{\overset{k_1}{\rightleftharpoons}}$ E.S $\xrightarrow{k_3}$ E + P

Input (plain text file):	Rate terms:	Rate equations:
E + S ---> ES : k1	$k_1 \times [E] \times [S]$	$d[E]/dt = -k_1 \times [E] \times [S] + k_2 \times [ES] + k_3 \times [ES]$
ES ---> E + S : k2	$k_2 \times [ES]$	$d[ES]/dt = +k_1 \times [E] \times [S] - k_2 \times [ES] - k_3 \times [ES]$
ES ---> E + P : k3	$k_3 \times [ES]$	

Similarly for other species...

System of Simple, Simultaneous Equations

HOW DYNAFIT PROCESSES YOUR BIOCHEMICAL EQUATIONS

$E + S \underset{k_2}{\overset{k_1}{\rightleftharpoons}} E.S \xrightarrow{k_3} E + P$

"The LEGO method" of deriving rate equations

Input (plain text file):

```
E + S ---> ES  :  k1
ES ---> E + S  :  k2
ES ---> E + P  :  k3
```

Rate terms:

$k_1 \times [E] \times [S]$

$k_2 \times [ES]$

$k_3 \times [ES]$

Rate equations:

Initial rate kinetics

TWO BASIC APPROXIMATIONS

1. **Rapid-Equilibrium** Approximation

$E + S \underset{k_2}{\overset{k_1}{\rightleftharpoons}} E.S \xrightarrow{k_3} E + P$

assumed very much **slower** than k_1, k_2

2. **Steady-State** Approximation

New in DynaFit

- *no assumptions* made about relative magnitude of k_1, k_2, k_3
- concentrations of enzyme forms are *unchanging*

Initial rate kinetics - Traditional approach

DERIVE A MATHEMATICAL MODEL FROM BIOCHEMICAL IDEAS

$E + S \underset{k_{-1}}{\overset{k_{+1}}{\rightleftharpoons}} E.S \xrightarrow{k_{+2}} E + P$

$E + I \underset{k_{-3}}{\overset{k_{+3}}{\rightleftharpoons}} E.I$

MECHANISM

Think!

$$v = k_{+2}[E]\frac{k_{+1}k_{-3}[S]}{k_{-3}(k_{-1}+k_{+2}) + k_{-3}k_{+1}[S] + k_{+3}(k_{-1}+k_{+2})[I]}$$

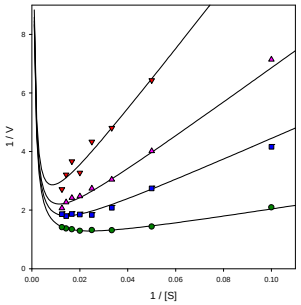
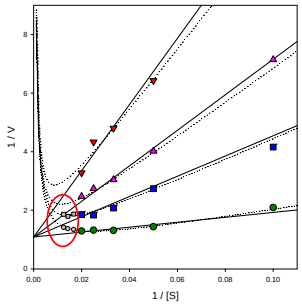
Double-reciprocal plot is nonlinear



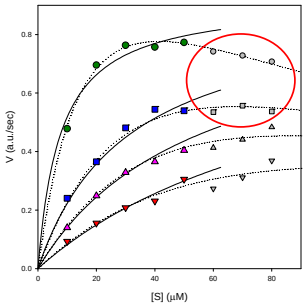
Kuzmic *et al.* (2006) *FEBS J.* **273**, 3054-3062.

DR plot obscures deviations from the model



Kuzmic *et al.* (2006) *FEBS J.* **273**, 3054-3062.

Direct plot makes model departures more visible



Kuzmic *et al.* (2006) *FEBS J.* **273**, 3054-3062.

Summary: Enzyme kinetics made (almost) easy

HOW DO I BUILD A MATHEMATICAL MODEL FOR AN ENZYME MECHANISM?

- Let the **computer** derive your model - don't bother with algebra.
- For many important mechanisms, algebraic models don't exist anyway.
- The theoretical foundation is simple and well understood:
  - **mass action law**
  - **mass conservation law**
- The same set of LEGO-like rules apply to all types of kinetic models:
  - *reaction progress curves*
  - *initial reaction rates*
